Overtemperature devices

Catalogue F196.en

Fusible overtemperature protection and tripping devices

Schaltbau fusible overtemperature protection and tripping devices ensure fail-safe thermal cutout protection against overheating of electric air heaters as used in rail vehicles and stationary heating systems. The devices are a prerequisite for fire protection and operate totally independent of the heater controls.

Represented in this catalogue are stock items. If you need a variant like, for example, one with a tripping device for water tanks or a different rod length, do not hesitate to contact us. We are capable of both designing and producing a wide range of specialised devices and will manufacture to customer requirements. In this case, however, minimum order quantities apply. There is also a stainless steel version available for use in harsh environments.

Tripping the fuse

The device must be wired into the heater load circuit (see diagram on page 3). Prior to installation, every device of the various series must be fitted with a fusible link. Fusible links are available with a number of trip temperatures, so you can order the one fusible link which meets exactly the requirements of your application (see tables on page 4). That is why fusible links are not included in delivery of any overtemperature protec-

tion or tripping device.

Insufficient air flow or failure of heater control results in rapid overheating of the system. When the fixed temperature set point of the fusible link is exceeded, the device shorts the heater load circuit, tripping a series-connected fuse. This stops the flow of current through the components, and provides protection against any return to operation of the heaters in an overtemperature condition.

Features

- Fail-safe overtemperature protection of heater coils and tubular elements
- Tripping function independent of control voltage
- Replacement fusible link necessary after tripping operation
- Optional auxiliary contact for version ZH437
- Applicable standards: IEC 60077, IEC 50124-1

Applications

- Electric open coil and finned tubular heaters
- Electric air heaters

Specifications

ZH037 Exxx, ZH437 Exxx Fusible links

ZH037 Exxx fusible links are for use with the short Series ZH437 K-KG overtemperature protection devices and the Series ZH037 K, ZH037 K VA, ZH437 K-HK and ZH437 K-K tripping devices.

Ordering code	Trip temperature (tolerance ±10 %)	Colour code
ZH037 E090	90 °C	black
ZH037 E103	103 ℃	blue
ZH037 E130	130 °C	green
ZH037 E150	150 °C	red
ZH037 E175	175 ℃	grey
ZH037 E200	200 °C	yellow
ZH037 E236	236 ℃	white

ZH437 Exxx fusible links are for use with the Series **ZH437** overtemperature protection devices as well as the Series **ZH437 K, ZH437 K VA**, **ZH437 K-H** and **ZH437 K-K3** tripping devices.

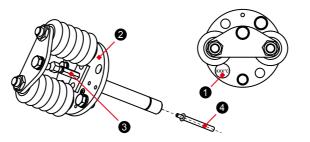

Ordering code	Trip temperature (tolerance ±10 %)	Colour code
ZH437 E090	90 °C	black
ZH437 E103	103 ℃	blue
ZH437 E130	130 °C	green
ZH437 E150	150 ℃	red
ZH437 E175	175 ℃	grey
ZH437 E200	200 ℃	yellow
ZH437 E236	236 °C	white

Assembly, Circuit diagram, Maintenance instructions

Assembly instructions:

- Prior to assembly, check spring function! Switch rod must not get stuck
- 2. Remove label **1** from anti-adhesive paper, ensure clean mounting plate **2** and stick label on.
- 3. Manually push switch rod **3** backwards against pressure spring force and hold.
- 4. Manually screw fusible link 4 inside switch rod.
- 5. The fusible link must not be damaged or deformed when being screwed in!
- 6. Treat fusible link with CARE to avoid any damage that might ensue by hitting, bending, or canting.

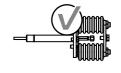

Maintenance instructions:

- Check overtemperature devices every 4 years for effectiveness (spring
 resistance / spring return insured after tripping). Push switch rod
 backwards against spring resistance. Remove fusible link from switch
 rod. When you let go the switch rod it should reach the terminal plate
 exerting discernible contact pressure. Caution: Severely corroded and
 polluted devices must be replaced.
- Replace fusible links every 4 years since they are subject to a chemical aging process which is further negatively influenced by harsh environmental conditions such as heavy pollution or varying humidity. In general, we recommend replacing the overtemperature device every 8 years and devices which were delivered before 2007 every 6 years. It is possible to use the devices even longer under favourable conditions but this cannot be guaranteed. For use in harsh environments we recommend the stainless steel version of the overtemperature device (version VA).

Mounting, Mounting orientation:

- When mounting an overtemperature protection or tripping device make sure that its fusible link is fully placed in the airflow generated by the heater and an optional reflector plate is streamlined with it.
- Overtemperature tripping devices are designed to mount horizontally and angled down respectively (see below drawing) or else their tripping function might be impaired.

Allowable temperature range:

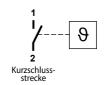

Max. working temperature 236° C

- Max. ambient temperature
 with aux. switch 85° C
- without aux. switch 150° C
- (i)

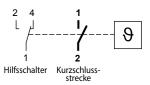

\ Note:

Trigger speed is to a great extent determined by the overall structure of the system. We, therefore, recommend field testing of the actual reaction time of the system beforehand.
